EJ-TECHNOLOGIES LAUNCHES JPROFILER 2.2
JProfiler adds support for Java Web Start, integrates into
IBM WebSphere 5 and Sun ONE Application Server 7

Munich, Germany, March 18, 2003 – ej-technologies GmbH launched today JProfiler 2.2, the first all in one profiler designed to help developers manage performance risks throughout the development process and produce fast, reliable enterprise applications. Developers use profiling technology to identify performance bottlenecks and memory leaks during the development stage of an application. JProfiler is the only enterprise-level Java tool available today to the development community that integrates CPU, memory and thread profiling in one powerful and robust application. JProfiler is available worldwide immediately.

“JProfiler continues to excel with its integrations into application servers and IDEs,” said Dr. Ingo Kegel, CEO of ej-technologies. “A profiling tool doesn’t have to be hard to use in a complex environment. JProfiler proves that.”

The full array of features integrated in JProfiler makes this product an excellent quality assurance tool and an ideal supplement to conventional debuggers. The early integration of JProfiler into the development process enhances the quality of the final application and reduces overall programming issues that usually arise far later and at higher cost.

The latest release of JProfiler adds the following features:

- Integration with Java Web Start technology by Sun Microsystems.
- A class-resolved real-time allocations monitor
- Offline profiling and a profiling API for use in scripted environments
- New integration wizards for IBM WebSphere 5 and Sun ONE Application Server 7
- New IDE integrations for IntelliJ IDEA and Borland JBuilder 8
- Major performance improvements and many usability enhancements
