EJ-TECHNOLOGIES LAUNCHES JPROFILER 2.3

JProfiler adds support for Java Web Start, integrates into IBM WebSphere 5 and Sun ONE Application Server 7

Munich, Germany, July 2, 2003 – ej-technologies GmbH launched today JProfiler 2.3, the first all in one profiler designed to help developers manage performance risks throughout the development process and produce fast, reliable enterprise applications. Developers use profiling technology to identify performance bottlenecks and memory leaks during the development stage of an application. JProfiler is the only enterprise-level Java tool available today to the development community that integrates CPU, memory and thread profiling in one powerful and robust application. JProfiler is available worldwide immediately.

“This release focuses on making things easier for developers who search for memory leaks.” said Dr. Ingo Kegel, CEO of ej-technologies. “JProfiler’s new ‘path to root analysis’ is an important addition for this purpose.”

The full array of features integrated in JProfiler makes this product an excellent quality assurance tool and an ideal supplement to conventional debuggers. The early integration of JProfiler into the development process enhances the quality of the final application and reduces overall programming issues that usually arise far later and at higher cost.

The latest release of JProfiler adds the following features:

- Path to root analysis for easier fixing of memory leaks
- New heap walker mode for focusing on memory leaks
- A new integration wizard for profiling the Java browser plug-in
- New application server integration wizards for BEA Weblogic 8.1, Apache Tomcat 5.0, JBoss 4.0, Novell exteNd 5
- New IDE integrations for Netbeans 3.5, Sun ONE Studio 5, Eclipse 2.1 and Borland JBuilder 9
- A new floating license scheme
- Various enhancements and usability improvements
