EJ-TECHNOLOGIES LAUNCHES JPROFILER 2.4
Increased flexibility for memory profiling and
performance improvements

Munich, Germany, November 7, 2003 – ej-technologies GmbH launched today JProfiler 2.4, the first all in one profiler designed to help developers manage performance risks throughout the development process and produce fast, reliable enterprise applications. Developers use profiling technology to identify performance bottlenecks and memory leaks during the development stage of an application. JProfiler is the only enterprise-level Java tool available today to the development community that integrates CPU, memory and thread profiling in one powerful and robust application. JProfiler is available worldwide immediately.

“Memory profiling just got a lot easier.” said Dr. Ingo Kegel, CEO of ej-technologies. “At ej-technologies, we keep a tight development focus on performance and the use cases of our customers.”

The full array of features integrated in JProfiler makes this product an excellent quality assurance tool and an ideal supplement to conventional debuggers. The early integration of JProfiler into the development process enhances the quality of the final application and reduces overall programming issues that usually arise far later and at higher cost.

The latest release of JProfiler adds:

- Improvements in memory profiling
- Improvements in the heap walker
- Performance improvements
- Various enhancements and usability improvements
