EJ-TECHNOLOGIES LAUNCHES JPROFILER 4.0

Munich, Germany, June 10, 2005 – ej-technologies GmbH, a leading vendor of Java tools, launched today JProfiler 4.0, the first all in one profiler designed to help developers manage performance risks throughout the development process and produce fast, reliable enterprise applications. Developers use profiling technology to identify performance bottlenecks and memory leaks during the development stage of an application. JProfiler is the only enterprise-level Java tool available today to the development community that integrates CPU, memory and thread profiling in one powerful and robust application. JProfiler 4 is available worldwide immediately.

"The new J2EE features are a first in the Java profiler market." said Dr. Ingo Kegel, CEO of ej-technologies. "With this new kind of information, JProfiler provides an unprecedented level of insight into Java applications. New features like aggregation levels or the chronological analysis of object allocations make JProfiler an extremely powerful tool."

The full array of features integrated in JProfiler makes this product an excellent quality assurance tool and an ideal supplement to conventional debuggers. The early integration of JProfiler into the development process enhances the quality of the final application and reduces overall programming issues that usually arise far later and at higher cost.

The latest release of JProfiler adds:

- Support for JVMTI
- A non-blocking startup mode
- Measurement of JDBC, JMS and JNDI calls
- Call tree splitting for request URLs
- New hot spot types for J2EE service calls and URL invocations
- Automatic J2EE component detection
- Aggregation levels on methods, classes, packages and J2EE components
- Recording of object allocation times
- A new "Time" view in the heap walker

- Global bookmarks for all time-resolved graphs
- Many smaller enhancements and usability improvements.
