EJ-TECHNOLOGIES LAUNCHES JPROFILER 5.0

Munich, Germany, April 27, 2007 – ej-technologies GmbH, a leading vendor of Java tools, launched today JProfiler 5.0, the premier all in one profiler designed to help developers manage performance risks throughout the development process and produce fast, reliable enterprise applications. Developers use profiling technology to identify performance bottlenecks and memory leaks during the development stage of an application. JProfiler is the only enterprise-level Java tool available today to the development community that integrates CPU, memory and thread profiling in one powerful and robust application. JProfiler 5 is available worldwide immediately.

"As profiling is increasingly used in production systems, users need more ways to control the profiler in unattended situations." said Dr. Ingo Kegel, CEO of ej-technologies. "With the new trigger and action system in JProfiler 5, it is now possible to configure unattended profiling runs in the JProfiler GUI without the need to modify your own code. On a related note, interoperability with the new diagnostic tools in Java 5 and Java 6 is one of the main topics of this release."

The full array of features integrated in JProfiler makes this product an excellent quality assurance tool and an ideal supplement to conventional debuggers. The early integration of JProfiler into the development process enhances the quality of the final application and reduces overall programming issues that usually arise far later and at higher cost.

The latest release of JProfiler adds:

- Powerful triggers and actions
- Support for reading and writing HPROF memory snapshot files
- VM telemetries overhaul with additional VM telemetries
- Redesigned session settings
- Call tracer view
- eclipse integration: support for WTP launch configurations
- JProfiler MBean for controlling the profiling agent
